The majority of cancer patients receive radiation as part of their treatment, either with traditional photon or proton radiotherapy, or with carbon ion radiotherapy pioneered by the Japan National Institute of Radiological Sciences. Radiotherapy is used to treat some of the deadliest cancers known to humankind, such as head and neck cancers; bone and soft tissue tumors; and lung, prostate, rectal, and pancreatic cancers.

Oncologists, cancer researchers, educators, and other interested parties should attend to learn about the latest advances in basic and translational research, medical physics, and clinical practice related to photon, proton, and carbon ion radiotherapy. The University of Colorado School of Medicine designates this live activity for 9.5 of AMA PRA Category 1 Credits.™
